

AMENDMENTS TO THE SPECIFICATION

Please amend the paragraph that bridges pages 6-7 of the specification as follows
(Applicant refers to the page numbers which are printed on the application as filed):

Figure 3 is a flow chart describing one exemplar embodiment of the operation of the present invention. In step 102, the Presentation Server receives a request for content. The content can be a Web page, media, data, an application, or anything else accessible via a network. In step 104, the Presentation Server accesses a mark-up language description of the content in response to the received request. In some embodiments, a mark-up language description is not used and, thus, step 104 is not performed. In step 106, Presentation Server accesses any data and/or media in response to the request or in response to the mark-up language description. In some instances, the request will not require any data or media and, therefore, step 106 can be skipped. In step 108, the mark-up language description, data and/or media are ~~compiled~~ compiled to create executable code for a user interface. In step 110, the executable code is transmitted to the client Presentation Renderer. In step 112, the executable code is executed at the client Presentation Renderer.
